

Experiment 5

Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Aim

To design and build a functional dashboard, report, and custom UI pages for a Hotel Room Booking application using a low-code UI Builder, enabling users to capture guest booking details, visualize booking statistics, and manage meal plan categorization.

Procedure

- Open the UI Builder tool and create a new application named "Hotel Room Booking & Front Office".
- Create a new Board page and title it "Hotel Booking Dashboard".
- Add a heading element with the title "Hotel Room Booking Dashboard" for the page.
- Insert a Button widget labeled "Number of Guests" to link to the guest count chart.
- Add an Order Status section using Report/Card widgets to display Room Type details for each booking.
- Insert a Button widget labeled "Room Booking Form" to allow navigation to the booking entry form.
- Add a Gauge widget to visually represent a target metric (e.g., occupancy or booking count) with min, max, and target indicators.
- Insert a Button widget labeled "Meal Plan" to link to the meal plan categorization board.
- Create a Chart widget titled "Number of Guests" as a bar chart plotting Guest Name against Total Number of Guests, with a Regenerate option to refresh data.
- Build a "Meal Plan" board with three swimlane columns — Room Only, Breakfast Included, and All Meals Included — and populate guest cards under the relevant column based on their selected meal plan.
- Create a "Room_Booking_Form Report" as a data table/grid capturing fields: Guest Name, ID Proof Number, Number of Guests, Email Address, Contact Number, Permanent Address, Room Type, Meal Plan, and Amenities Required.
- Enter sample guest booking records into the report/form to populate the dashboard, chart, and meal plan board dynamically.
- Save and publish the application, then verify that the dashboard, chart, meal plan board, and report all reflect the entered data correctly.

Output

The screenshots below show the working UI Builder output for the Hotel Room Booking application.

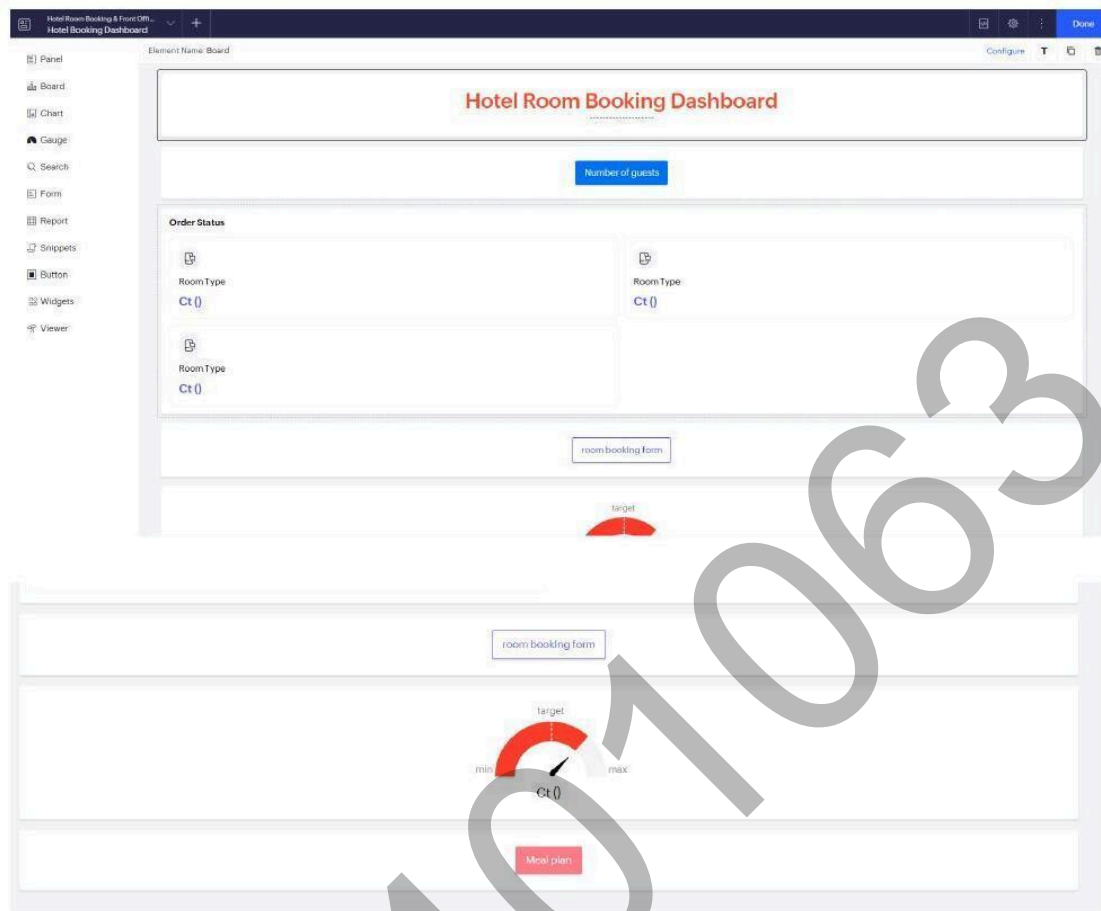

Fig 1: Hotel Booking Dashboard layout (Board, Order Status, Gauge, Meal Plan button)

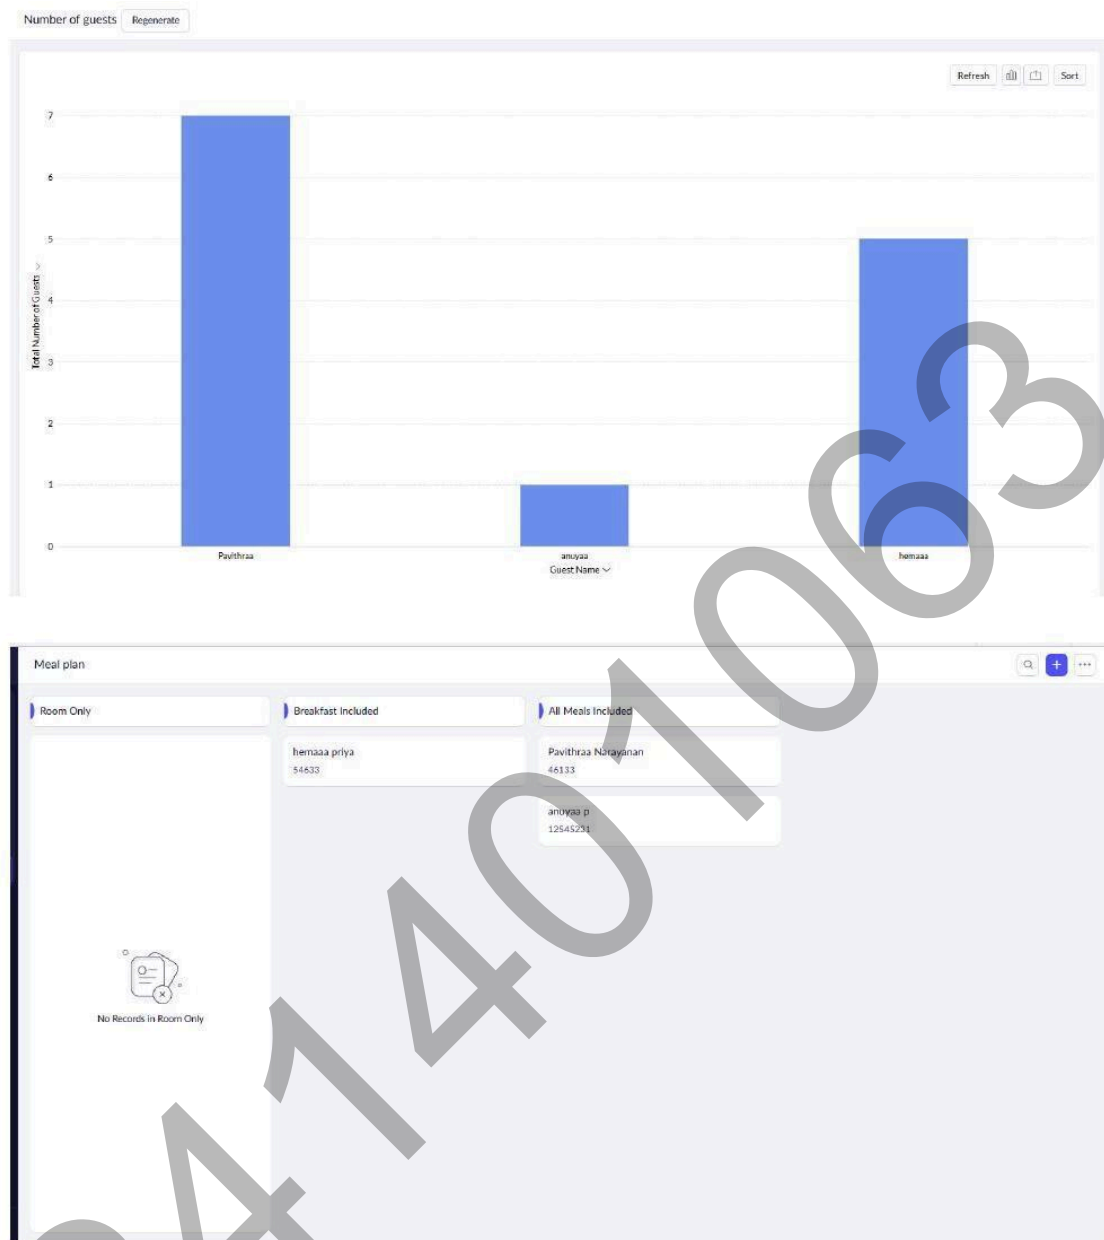

Fig 2: Number of Guests bar chart and Meal Plan board (Room Only / Breakfast Included / All Meals Included)

Guest Name	ID Proof Number	Number of Guests	Email Address	Contact Number	Permanent Address	Room Type	Meal Plan	Amenities Required

Result

A Hotel Room Booking dashboard was successfully designed and implemented using the UI Builder. The dashboard displays a real-time bar chart of the number of guests per booking, a gauge widget for target/occupancy tracking, a meal-plan swimlane board that automatically categorizes guests into Room Only, Breakfast Included, and All Meals Included, and a detailed Room Booking Form report capturing complete guest information such as ID proof, contact details, room type, meal plan, and amenities required. The application thus demonstrates the effective use of custom pages, reports, charts, and dashboards for front-office hotel management.
